Day 3 Task: Account Lockdown

Step 1: Lockdown Checklist

#	Action	Done	Note
1	Install a password manager and create a master passphrase	Yes	Using google password manager and passkey
2	Enable MFA on your main email using an authenticator app	Yes	Set up using Google Authenticator app
3	Save your email's MFA backup codes somewhere safe	Yes	Written down in my notes section
4	Check your email on haveibeenpwned.com — write the number	Yes	Number of breaches: 0.
5	Change the password on every breached or reused account	Yes	Changed the same password for different account
6	Enable MFA on one more account	Yes	Enabled MFA on my Instagram account
7	Check your email's recovery phone and recovery email	Yes	Both are correct,up to date and working
8	If you have security questions, replace answers with random words	Yes	Replaced it with my personal things that no one knows other than me

Step 2: Password Strength Test

Style	Your made-up example	Estimated crack time	Why
Short + symbols (8 chars)	T@c0$!23	hours	8 characters is simply too short to defend against for modern brute-force cracking tools but still little complex for human cracking
Common word + year	Password2024	Instant	Hackers use dictionary lists and know people add current years to the

			end of words.
4-word passphrase	Hello-amima-mia-adirido	Centuries	The length (22 characters) makes the mathematical combinations too large for computers to crack quickly.

Step 3: Two Questions

1. Which account of yours would hurt most if taken over, and what did you change today to protect it?

My primary Gmail account would hurt the most because hackers could use it to reset my passwords for banking, social media, and university portals. Today, I protected it by setting up an Authenticator App (MFA) instead of relying on SMS if it it hacked my all saving gone.

2. Your phone shows 15 MFA approval prompts you didn't request, then a WhatsApp from "IT support" saying "just approve it and they'll stop". What do you do?

I would firmly deny all the MFA prompts and immediately block the WhatsApp number. This is an "MFA fatigue" attack combined with social engineering, and a real IT support team would never ask me to approve unexpected prompts over WhatsApp.
